Niger State.

ABSTRACT

This study examined the Impact of Lecture-Enriched with Excursion Method on Interest and Academic Performance in Landform processes among Secondary School Students in Minna Metropolis, Niger State. The study comprised of three objectives with their corresponding research questions and null hypotheses. The research design used was Quasi-experimental design. Also, the study involved the use of experimental as well as control groups with emphasis on pre-test, post-test and post-posttest. The population of this study covered all the fifteen (15) public senior secondary schools (SSII) those offering Geography with total enrolment of five thousand, eight hundred and forty-five (5845) as at 2015/2016 academic session out of which 100 students were sampled out from the two co-education schools selected using stratified random sampling technique. Two validated instruments were developed by the researcher namely; Landform Processes Performance Test (LPPT) and Landform Inventory Interest Questionnaire (LIQ) with reliability coefficients of 0.7 and 0.8 respectively. Research questions raised were answered using descriptive statistics of means and standard deviations while null hypotheses formulated were tested with inferential statistics using t-test and U-test at 0.05 level of significance. The finding showed that, there was significant difference between the mean academic performance scores of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method. Also, the finding indicated that, there was significant difference between the interest ability of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method at senior secondary schools of the study area. Similarly, the finding calibrated that, there was no significant difference between the mean academic performance scores of male and female students taught landform processes using Lecture-Enriched with Excursion Method only at senior secondary schools of the study area. The study recommended the need of State

Ministry of Education and Science Teacher's Association of Nigeria (STAN) to encourage teachers on the use of Lecture-Enriched with Excursion Method in teaching Geography at secondary schools level. Conclusion was also drawn and suggestions for further study were also given.

INTRODUCTION

Science is concerned with critical analysis of fundamental issues that relate or affect scientific knowledge such as equality, autonomy, equity, freedom etc. growth and development of science over many centuries, theories that help us to know and understand the learners, learning situation, process of learning, factors that promote or hinders learning, classroom management as well as examination and analysis of the kind and nature that influence society. Asiruwa (2005) observed science as the study that involves systematic study of natural phenomena which allows the students to experience the richness and excitement of the natural world, the process of inquiry critical thinking and demonstration of skills.

Geography was derived from two Greek words "Geo" meaning the Earth, and "Graph" meaning description. Therefore, Geography could be defined simply as the description of the earth. Geography is the study of the earth's surface and its features and the processes that occur. It was also centred with the study of the size, shape and movement of the earth and other heavenly bodies. As defined by Iwena (2008) Geography was better defined as the study of people, their activities, places and physical surrounding within the earth.

Geography is an academic subject taught in senior secondary schools and tertiary institutions in Nigeria. It is the study of natural features and phenomena on the earth's

surface and in the atmosphere. It also focuses on locations, space relations and changes of physical phenomena on the earth's surface. Thus, Geography as an academic subject is geared towards teaching the interrelationships among phenomenon on the earth surface and those in the atmosphere. The concept of weather is a component of Geography course that develops the skills of observation, measurement, recording, experimenting and influences of Geographic data among students (Saulawa, 2005 and Abdulkarim, 2010).

The objective of teaching Geography at Senior Secondary School level as spelt out by National Policy on Education (FRN, 2013) include given students a sound knowledge of the immediate environment and inculcating meaningful knowledge students so as to contribution positively to their community and nation at large. Despite all these and other numerous importance of Geography in the areas of human and national development, the subject has for many years been experiencing a dreadful impede.

There were various strategies for teaching Geography which range from the use of laboratory activities, lecture, discovery, inquiring, demonstration, problem solving, and simulation, per-led inquire, class wide guided inquiring among others (Usman, 2010, Obeka 2010, and Nsofor, 2001). The lecture method was a teacher-centred method where by

the teacher does most of the talking, while the students listen and take notes. It involved verbal presentation of idea, concept and generalization of facts. Ati and Sawa (2011) reported that, Excursion studies were essential in bridging the gap between academic world of classrooms and experiential knowledge of Geography students such that, they could articulate and relate learning to experience and comprehend better, the processes that give rise to certain patterns over space. Consequently, this study was based on Lecture Enriched with Excursion to ensure effective teaching of Geography. Moreover, Adeyemi (2008) opined that the learning of Geography should be based on teaching materials, variety of teaching methods and dynamic approach. Students learn through observation and doing, which signifies hands on and minds on theories learners could be introduced to the phenomena of nature which surround them through the use of fascinating learning materials that will make them to be exploratory in nature. It was observed that, research findings had proved being a male or female does not depend on the quality of brain (superior or inferior) that one possess (Ochu, and Atagher, 2011). Mangal (2010) observed that interest was the key factor and driving force that help us in paying attention as well as remaining engaged in our so attended activities. It was the great motivating force and reservoir of one's inner potential capable of moulding and shaping one's behaviour and personality make-up in a particular field. Interest are not permanent and fixed, they changed as a result of maturation, learning and other internal as environmental conditions and factors.

Retention was the ability to remember things, task or material learned previously. Bichi (2002) perceived retention as the ability to retain and later recall information or knowledge gained after learning. It was the endurance of behaviours, which have been learned, or acquired when the behaviour was not being utilized. Aggarwal (2008) explained that, the term retention was the process of relegation of the past experience in the sub-conscious mind of the individual in the form of mental experience. The mind acquired the material of knowledge through sensation and perception. These acquired materials in the mind need to be preserved inform and images for knowledge to develop. Whenever a simulating situation occurs retained images were received or reproduced to make memorization possible.

Landforms are characteristically shaped features of earth's surface such as hills, valley, depositional and erosion landforms etc. Therefore, landforms can be seen as a noted decrease in any adverse influence on the carrying capacity of land, indicated by decreased soil fertility, increased soil erosion, removal of vegetation cover and general negative changes in land use which compromised the supply and quality of ground and surface water as well as biodiversity (Charles, and Lisa, 2013). Hence, the researchers determined the Impact of Lecture-Enriched with Excursion Method on Academic Performance and Interest in Landform Processes among Secondary School Geography Students Minna Metropolis, Niger State.

Statement of the Problem

Chief Examiner's Report (2015), has reported the consistent

failure in Geography at SSCE level (2010-2015). The results showed that about 60 to 75 percent of the candidates that examined in Geography failed to make a credit pass in Geography. When comparing the result there was marginal decline in the performance of the candidates simultaneously. Tshibola (2003) attributed the students' poor performances to the often use of traditional teaching method such as the lecture method. There was need for the teachers to shift from their present lecture method, teacher centred to teaching methods such as hands on and minds on pedagogies, student centred, use of laboratory facilities, equipment, charts, maps, fieldtrip and excursion and teaching strategy that will enhance academic performance of the students.

Insufficient use of instructional materials by staff and students for teaching geography, like using computers, globes, meteorological stations, water reservoirs, forest reserved were reported by Aderogba (2012) and Abdulkarim (2010) as the major challenges of teaching geography in secondary schools of Nigeria. In the study conducted by Abdulkarim (2011) observed that 85% of senior secondary schools in Kaduna state operates the teaching of Geography with obsolete and inadequacy of equipment/media for teaching the subject. Existing realities of senior secondary schools in Nigeria revealed a dismal utilization of Geography equipment by the teachers and student.

The National Geography Curriculum was designed to cover the three domains of education; cognitive, affective and psychomotor domains of a learner (NERDC, 2007, Obeka, 2009). However, teachers dispensed and

imparted only the cognition skill to the detriment of other two skills. In essence, the interest (affective) and psychomotor aspects of the course were neglected. This situation has resulted to the low rate of interest and academic values of geographical studies by students (Amosom, 2008).

According to Adeyemi (2008) mentioned that, it has been observed that science teachers in many Nigeria's schools rely heavily on the use of oral or verbal as well as didactic or lecture method to teach science subjects. Whereas, the students result to rote learning which did not facilitate thorough understanding of science. Likewise, the method was not effective enough to enhance modern learning of science and technology. This was because, it created temporary or false understanding and after some times, the learner forgets virtually what he/she has learnt. Therefore the researchers investigated the Impact of Lecture-Enriched with Excursion Method on Academic Performance and Interest in Landform Processes, among Secondary School Geography Students in Minna Metropolis, Niger State.

Objectives of the Study

The general aim of the study is to examine the Impact of Lecture-Enriched with Excursion Method on Academic Performance and Interest in Landform Processes, among Secondary School Geography Students in Minna Metropolis. The following objectives were to:

- i. Determine the Impact of Lecture-Enriched with Excursion Method on students' Performance in learning landform processes.
- ii. Investigate the Impact of Lecture-Enriched with Excursion Method

- on students' Interest in learning landform processes.
- iii. Compare the difference in the Academic Performances of male and female students when exposed to Lecture-Enriched with Excursion Method in learning landform processes.

Research Questions

The following research questions were raised for this study.

- i. What is the difference in the mean academic performance scores of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method?
- ii. What is the difference between the mean interest ability of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method?
- iii. What is the difference between the mean academic performance scores of male and female students taught landform processes using Lecture-Enriched with Excursion Method?

Null Hypotheses

The following null hypotheses were formulated and tested at $\alpha = 0.05$ level.

- HO1:** There is no significant difference between the mean academic performance scores of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method.
- HO2:** There is no significant difference between the mean interest scores of students taught landform processes

using Lecture-Enriched with Excursion Method and those taught using Lecture Method.

- HO3:** There is no significant difference between the mean academic performance scores of male and female students taught landform processes using Lecture-Enriched with Excursion Method.

METHODOLOGY

The research design employed for this study was Quasi-experimental design, with emphasis on pre-test, post-test, and post-posttest according to Sambo (2008). The study involved the use of experimental and control groups. Both experimental and control groups were assigned pretest on academic performance and prior to interest, this was done in order to get the differences in terms of ability between experimental and control groups. The population of the study consisted of all the public Senior Secondary School Two (SSSII) Students, those offering Geography in Government Owned Schools in Minna Metropolis, Niger State. This comprised of eleven (11) co-education (mixed) schools and four (4) single schools with number of 2898 males and 2949 females which resulted to total of fifteen (15) Senior Secondary Schools with total enrolment of five thousand, eight hundred and forty-five (5845) students.

The sample for this study comprised of two Senior Secondary School Two (SSSII), those offering Geography. Stratified random sampling technique was used to select the sample for this study so as to maintain the proportion of the population. This technique was used

in order to ensure that, variable that may likely impinge on the result of the study were adequately taken care off. They include; the religious affiliation, socio-economic status, and other characteristics such as sex, age, academic qualification, etc. Therefore, the use of the technique reduced sampling error and ensures even distribution of the different variables observed among the students. The research sample was made off one hundred (100) students which were randomly selected from two governments owned secondary schools in Minna Metropolis. Two co-education schools were used. Fifty (50) students were assigned to experimental group while fifty (50) students were also assigned to control group.

Two instruments were developed by researcher to generate data for this study. These include: Landform Processes Performance Test (LPPT) and Landform Inventory Interest Questionnaire (LIIQ). LPPT was forty (40) items performance test adapted from WAEC and NECO pass questions of (2000-2015) by the researcher to examine the academic performance of students in landform processes. The instrument was derived from landform processes using senior secondary school geography syllabus. The LPPT comprised of forty (40) objectives multiple choice items each with four alternatives (A-D). The students were freely allowed to select the correct answers and each correct answer was assigned one mark while the overall mark was forty (40) marks.

The Landform Inventory Interest Questionnaire (LIIQ) was a twenty (20) items interest inventory questionnaire adapted by the researcher to examine the interest of

the students before and after the treatment on landform processes of Geography. The items were developed using the Likert's (1973) 5-point rating scale. These were Strongly Agreed (S.A=5), Agreed (A=4), Undecided (U=3), Disagreed (D=2) and Strongly Disagreed (S.D=1) respectively. Each option carried weight in the order of priority from 5-1 in positive interest responses and from 1-5 in negative interest responses. The students were asked to freely indicate their interest on Landform Processes of Geography by simply ticking one of the five options that suit their interest.

The LPPT and LIIQ draft were validated by the members of supervisory team for this study whom were panel of experts with a PhD qualification and rank of senior lecturer in the field of Geography Education at Department of Geography Education and one expert in Department of Geography in Ahmadu Bello University, Zaria. Forty (40) items of LPPT and twenty (20) items of LIIQ were examined on 30 students SSII in Ahmadu Bahago Secondary School, Minna which was not part of the sample schools but part of the population of the study. The instruments were administered to the respondents using LPPT and LIIQ also respondents were given 50 minutes to answer all the items.

In this study, split-half method of reliability was employed to establish the reliability co-efficient of GPT and GIQ. Actually, the split half method (odd-even) was used to test the reliability of scores on thirty (30) students. Hence, the test scores were split into two equivalent halves, one from each half of the test and arranged as odd and even numbered items. The scores of the halves were correlated whereby Pearson Product Moment

Correlation Statistic (PPMCS) and Spearman Ranked Order Correlation Statistic (SROCS) were used to determine the reliability for the whole tests from the obtained correlation between the two half tests of LPPT and LIIQ respectively. The reliability co-efficient of LPPT was obtained as

0.7 and the reliability co-efficient of LIIQ was obtained as 0.8.

RESULTS

Research Question One: What is the difference between the mean academic performance scores of students taught landform processes using Lecture-Enriched with Excursion Method and those taught with lecture method?

Table 1: Mean and Mean Difference of Landform Processes on Performance Scores for the Experimental and Control Groups

Group	N	Mean	SD	Mean Difference
Experimental Group	50	23.27	7.09	9.36
Control Group	50	13.91	5.02	

The result shows that, there is a mean difference of 9.36 between the mean academic performance scores of students taught landform processes using Lecturer-Enriched with Excursion Method and those taught using Lecture Method. This proves that, the experimental group had mean score greater than that of the control group. This establishes the

evidence that, the treatment had improved student’s performance in landform processes positively.

Research Question Two: What is the difference between the mean interest scores of the students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method?

Table 2: Mean Rank and Rank Difference of Landform Processes on Interest of Students in Experimental and Control Groups

Group		N	Mean Rank	Rank Difference
Experimental Group	Pre-test	50	28.25	25.53
	Post-test	50	53.78	
Control Group	Pre-test	50	28.10	4.95
	Post-test	50	33.05	

Result compares the change in interest of students in experimental and control groups. From the result, the pre-test and post-test mean interest score of experimental group are 28.25 and 53.78 with the difference of 25.53, while the pre-test and post-test mean interest score of control

group are 28.10 and 33.05 with the difference of 4.95. The students taught landform processes using Lecture-Enriched with Excursion Method have the highest mean score. Based on the result presented, there is remarkable difference in the interest of students on landform processes.

Research Question Three: What is the difference between the mean academic performance scores of male and female students taught landform processes using Lecture-Enriched with Excursion Method?

Table 3: Comparison of Mean Scores of Male and Female Students in Experimental and Control Groups

Variable/Group	N	Mean	SD	Mean Difference
Experimental Group	Male	27	17.34	9.81
	Female	23	16.13	9.23

Result implies that, there is mean difference in male and female students of experimental. The experimental group mean score is 0.21. This establishes the sign that, the treatment had promoted the performance of both male and female students in landform processes significantly.

Testing of Null Hypotheses

The following null hypotheses were formulated and tested at

benchmark of 0.05 level of significance.

Null Hypothesis One (HO1): There is no significant difference between the mean academic performance scores of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method. Null hypothesis one is analyzed using t-test at $\alpha=0.05$.

Table 4: The t-test Analysis on Academic Performance of Students for Experimental and control Groups

Group	N	Mean	SD	Df	T	P	Remark
Experimental Group	50	41.3	10.7	98	28.6	0.01	Significant
Control Group	50	32.1	7.3				

Significant at $p < 0.05$

Statistics indicates a significant difference between the mean academic performance scores of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method; $t(50) = 28.6$, $P = 0.01$. With $P < 0.05$ the result suggests a difference in students' performance exposed to lecture and

excursion strategies. Therefore, HO1 is rejected.

Null Hypothesis Two (HO2): There is no significant difference between the mean interest scores of students taught landform process using Lecture-Enriched with Excursion Method and those taught using Lecture Method. Null hypothesis three is analyzed using Man Whitney (U-test) at $\alpha = 0.05$.

Corresponding author: Abdullahi Dokochi Mohammed
 ✉ abdullahid@ibbu.edu.ng
 Department of Science Education, Ibrahim Badamasi Babangida University, Lapai, Niger State.
 © 2023. Faculty of Tech. Education, ATBU Bauchi. All rights reserved

Table 5: Mann Whitney (U-test) Analysis among the Interest of Student of Experimental and Control Groups

Group	N	Mean Ranks	U	P	Remark
Experimental Group	50	63.92	3.77	0.01	Significant
Control Group	50	44.50			

Significant at $p < 0.05$

The result compares the change of interest of students in experimental and control groups. The result showed that, the experimental group and control group have mean rank values of 63.92 and 44.50 respectively. The Mann Whitney (U-test), $U(50) = 3.77$, $P = 0.01$. Since, the p-value of 0.01 is less than $p < 0.05$ level. This indicates that, there is a significant difference in the interest of students taught landform processes due to exposure to treatment against those taught without exposure to treatment. Therefore, the null hypothesis which states that, there is

no significant difference among the interest of students taught using Lecture Enriched with Excursion and those taught using Lecture Method is rejected.

Null Hypothesis Three (HO3): There is no significant difference between the mean academic performance scores of male and female students taught landform processes using Lecture-Enriched with Excursion Method. Null hypothesis four is analyzed using independent t-test at $\alpha = 0.05$.

Table 6: The t-test Comparison on Academic Performance of Male and Female Students in Experimental Group

Group	N	Mean	SD	Df	T	P	Remark
Male	27	29.26	4.3	48	1.96	0.06	Not Significant
Female	23	28.25	4.1				

Not Significant at $p > 0.05$

The result typifies no significant difference between the mean performance scores of male and females students taught landform processes using Lecture Enriched with Excursion; $t(27) = 1.96$, $P = 0.06$. With $P > 0.05$ the difference between the mean performance scores of male and female students' exposed to treatment is not significant. Hence, HO3 is retained.

The result showed that there is significant difference between the mean academic performance score of students taught landform processes using Lecture-Enriched with Excursion Method and those taught using Lecture Method. The experimental group therefore, achieved significantly greater than the control group. Therefore, the null hypotheses was rejected based on the finding which was in accordance with the finding of Ajaja, (2010) indicated that field work experience enhanced

DISCUSSION OF FINDINGS

Corresponding author: Abdullahi Dokochi Mohammed

Department of Science Education, Ibrahim Badamasi Babangida University, Lapai, Niger State.

© 2023. Faculty of Tech. Education, ATBU Bauchi. All rights reserved

students understanding of process of science and significantly influenced their performance in Geography.

The result showed that there is significant difference among the interest of students taught landform process using Lecture-Enriched with Excursion Method and those taught using Lecture Method. Therefore, the experimental group showed greater interest than control group base on the finding which was in accordance with finding of Bello, (2015) signified that, there was a significant difference in the interest of students due to exposure to treatment while Obeka (2010) signified that, no significant difference in the interest ability of male and female students in environmental education concepts of Geography due to exposure to demonstration and inquiry teaching methods.

The result showed that there is no significant difference between the mean academic performance score of male and female students taught landform processes using Lecture-Enriched with Excursion Method. In addition, male and female students exposed to Lecture Enriched with Excursion did not differ significantly. It is generalized that, Lecture-Enriched with Excursion Method is found to be gender friendly based on the finding which is in accordance with finding of Obeka, (2012) showed that, the use of innovative strategies in environmental education concepts of Geography proved to be effective in enhancing the performance of male and female students likewise gender friendly.

CONCLUSION

The analysis of the result portrayed that, the experimental group achieved statistically better as a result of the exposure to treatment. It

is evidence that, Lecture-Enriched with Excursion Method is effective in enhancing learners' academic performances and interest ability of the experimental group was fascinated significantly. This also showed that, the lecture method commonly used by teachers in secondary schools is not quite suitable for effective teaching and learning of Geography concepts and landform processes in particular because is not a student-centred approach. The exposure of male and female students to the treatment implied that, the two subjects gained actively from the treatment. This indicates that, the treatment is suitable for both male and female students meaning that, is gender friendly and not bias.

RECOMMENDATIONS

Based on the findings of this study, the researchers recommended that:

1. Professional association like Science Teachers' Association of Nigeria (STAN), Mathematics Association of Nigeria (MAN) and research centres like Nigerian Educational and Research Development Council (NERDC) and National Teachers' Institute (NTI) should incorporate the use of Lecture-Enriched with Excursion Method in science curricula as well as delivery instructions at senior secondary schools.
2. Seminars, workshops and conferences should be organized by secondary education board, STAN, ICASE, NTI, ETF and NERDC in order to train science teachers on effective implementation for the use of Lecture-Enriched with Excursion

- Method in teaching science subjects such as Geography.
3. Stakeholders in education, Non-governmental Organizations (NGOs), Parent Teachers' Association (PTA) and State Universal Basic Education Commission (SUBEC) should be encouraged and fascinated to provide sufficient funds so as to facilitate the tour on Lecture-Enriched with Excursion Method for delivery instructions in science subjects at senior secondary schools.
